

Gradients in CSS:

- > A gradient in CSS is a smooth transition between two or more colors.
- > Instead of using a single background color, gradients allow you to create attractive color effects for background.
- > Gradients are mostly used in: Backgrounds

Syntax: background: gradient-type(...);

OR

Syntax: background-image: gradient-type(...);

Types of Gradients in CSS:

1. Linear Gradient => Colors move in a straight line
2. Radial Gradient => Colors spread from the center in circular/elliptical form
3. Conic Gradient => Colors rotate around a center point
4. Repeating Gradient => Repeats the gradient pattern

1. Linear Gradient:

- > A linear gradient creates a transition of colors in a straight line.
- > Syntax: background: linear-gradient(direction, color1, color2, ...);

-> Directions in Linear Gradient:

Direction	Meaning
-----------	---------

1. to right	Left → Right
-------------	--------------

2. to left	Right → Left
------------	--------------

3. to top	Bottom → Top
-----------	--------------

4. to bottom	Top → Bottom
--------------	--------------

5. to top right	Bottom Left → Top Right
-----------------	-------------------------

2. Radial Gradient:

-> A radial gradient creates color spreading from the center of circle.

-> Syntax: `background: radial-gradient(shape, color1, color2);`

-> By default shape is circle.

3. Conic Gradient:

-> A conic gradient rotates colors around a center point.

-> It is used to create the: Pie Chart, Color Wheel

-> Syntax: `background: conic-gradient(color1, color2, color3);`

-> Example 1: Basic Conic Gradient:

```
div{  
    background: conic-gradient(red, yellow, green, blue);  
}
```

-> Example 2: Starting Angle:

```
div{  
    background: conic-gradient(from 90deg, red, blue);  
}
```

4. Repeating Gradients:

-> Repeating gradients repeat the color pattern again and again.

There are:

- 1.Repeating Linear Gradient => `repeating-linear-gradient()`
- 2.Repeating Radial Gradient => `repeating-radial-gradient()`
- 3.Repeating Conic Gradient => `repeating-conic-gradient()`
