

## # What is CSS?

- > CSS stands for Cascading Style Sheets
- > It is used to style HTML elements
- > It controls how a webpage looks (design, colors, layout)

Example:

HTML = Structure

CSS = Styling

## # Why do we use CSS?

- > Makes webpages beautiful and user-friendly.
- > Controls:

Text color

Fonts

Spacing

Layout

Backgrounds

## # CSS Syntax:

- > Selector {propertyName: propertyValue;}

A CSS rule has:

Selector → which element

propertyName → what to change

propertyValue → how to change

## # History of CSS:

1994 → Idea by Håkon Wium Lie

CSS1 → Basic styling

CSS2 → Layout & positioning

CSS3 → Animations, Flexbox, Grid (current)

CSS4 → Future (in progress)

## # Types of CSS:

-> We can provide CSS in 3 ways:

1. Inline CSS
2. Internal CSS
3. External CSS

### 1. Inline CSS:

-> The CSS which is written inside the HTML tag with the help of style attribute.

-> It is used for single element.

-> Example: `<h1 style="color: red;">Hello</h1>`

## 2. Internal CSS:

-> The CSS which is written inside the <style> tag.

-> It is used for single webpage.

-> Example:

```
<head>
  <style>
    h1 {
      color: blue;
    }
  </style>
</head>
```

## 3. External CSS:

-> The CSS written in a separate .css file.

-> It is used for multiple webpages.

-> To connect external CSS to HTML document we have to use of <link> tag.

-> Example: <link rel="stylesheet" href="style.css">

style.css = external css file

```
h1 {
  color: green;
}
```

## # Priority of CSS:

-> Priority order:

1. Inline CSS (Highest)
2. Internal CSS (Whichever is nearest to HTML element)
3. External CSS (Whichever is nearest to HTML element)

-> We can change the Priority order by using special keyword called as:

!important → highest priority
