

What is Media Queries?

-> Media Queries are used in CSS to make websites responsive.

Why Media Queries are Used?

1. Without media queries:

- Website may look good on desktop
- But break on mobile/tablet

2. With media queries:

- Layout adjusts automatically
- Text becomes readable
- Images resize properly
- Navigation becomes mobile-friendly

Structure of Media Query: (Syntax)

```
@media media-type and (condition) {  
  
}
```

Media Types:

1. screen -> Used for mobiles, laptops, tablets, desktops.
2. print -> Used while printing webpage.
3. all -> Default for all devices.

Condition:

1. min-width: Applies styles when width is greater than given value.
2. max-width: Applies styles when width is smaller than given value.

orientation:

- > Checks portrait or landscape mode.
- > It helps us apply different CSS when the screen rotates.

Portrait:

```
@media (orientation: portrait) {  
  
}
```

Landscape:

```
@media (orientation: landscape) {  
  
}
```

Common Responsive Breakpoints in CSS:

-> These are the most commonly used approximate breakpoints in real-world frontend development.

Device Type	Approx Width
-----	-----
Mobile Small	`320px`
Mobile Medium	`480px`
Mobile Large	`576px`

Tablet	`768px`	
Laptop Small	`992px`	
Laptop/Desktop	`1024px`	
Desktop Large	`1200px`	
Extra Large Screens	`1400px+`	

Most Common Industry Breakpoints:

```
/* Mobile */
```

```
@media (max-width: 576px) {
```

```
}
```

```
/* Tablet */
```

```
@media (min-width: 577px) and (max-width: 768px) {
```

```
}
```

```
/* Laptop */
```

```
@media (min-width: 769px) and (max-width: 1024px) {
```

```
}
```

```
/* Desktop */
```

```
@media (min-width: 1025px) {
```

```
}
```
