

Attributes:

-> The additional information about the tag is called as attributes.

OR

-> The properties of a tag is called as attributes.

-> We have to always provide the attributes inside the opening tag of HTML element.

Types of Attributes:

-> Following are some main types of attributes:

1. Core Attributes
2. Generic Attributes
3. Global Attributes

1. Core Attributes:

-> Core attributes are the fundamental attributes.

-> Means most of the time we are using these attributes.

-> For Ex: id, class, style, title

1. id = To provide unique identification (#id)
2. class = To access or target the multiple elements at a time. (.className)
3. style = To provide the inline css.
4. title = It is used for tooltip. (Internal Information)

2. Generic Attributes:

-> Generic attributes are used only with special tags.

-> For Ex: src, alt, href, width & height

1. src & alt = Image tag
2. href = Anchor Tag

3. Global Attributes:

-> Global attributes we can use with most of the elements.

-> For Ex: id, class, style, title, tabindex, accesskey, contenteditable, spellcheck, draggable, translate, lang, etc.
