

HTML Element:

-> A tag which has opening and its closing tag along with the content this complete structure called as Element in HTML.

For Ex: `<h1> My Webpage </h1>`

Here, `<h1>` = Opening Tag

`</h1>` = Closing Tag

My Webpage = Content

What is void or empty Elements?

-> The elements which doesn't consist of any kind of content is known as void or empty elements.

For Ex: `<img/>`, `<br>`, `<hr>`, `<meta>`, `<input>`, etc.

Types of Elements:

-> There are mainly 3 types of elements in HTML: 1. Block-Level Elements 2. Inline-Level Elements 3. Inline-Block Level Elements

1. Block-Level Elements:

-> The elements which can acquire the entire width of its parent container is known as block-level elements.

-> Block-level elements always starts from a new line.

-> We can change their height and width for the block level elements.

-> For Ex: All Headings tags, `<p>`, `<div>`, `<header>`, `<footer>`, etc.

2. Inline-Level Elements:

-> The elements which can takes the exact width of the content itself is known as inline-level elements.

- > Inline-level elements will come in a same line itself.
- > We cannot change the height and width for inline-level elements.
- > For Ex: , <a>, <button>, <input>, etc.

3. Inline-Block Level Elements:

- > It is a hybrid combination of inline and block level elements.
- > Means it will come in a same line itself as well as we can change their height and width.
- > For Ex: tag

Line Break Tag:

- > It is used to provide single line break in web page.
- > It is a self-closing tag.
- > For Example:

Horizontal Line Tag:

- > To provide the horizontal line we have to use <hr> tag.
- > It is a self-closing tag.
- > For Example: <hr>
